The TBI EDGE task force reviewed 88 outcome measures covering the domains of body structure and function, activities and participation evaluating each for psychometrics and clinical utility for patients with traumatic brain injury. Through literature review, analysis, and a modified Delphi procedure, recommendations were formulated for outcome measures that are highly recommended for use in rehabilitation settings. Additional measures are recommended, but not as strongly. Some measures were characterized as reasonable to use, but with insufficient study in individuals with TBI, indicating need for further study of psychometrics of these measures after brain injury.
